

## Press Release

Orientation and appointment management for Alzheimer's patients reinvented!

A new orientation application called "Orientation-2-Go" was designed for Alzheimer's patients to help them to find the right way to their appointments on time. In addition, the application offers a feature that helps patients find their way home. If the way home is not found for a certain present time, the application accompanies the patient home (by means of a map and voice announcement). The application is very easy to use and all settings can be made by caregivers, too.

Munich University of Applied Sciences, 07<sup>th</sup> November 2019: The new must-have application. Simple, innovative and pragmatic: orientation for Alzheimer's patients on a new level. Regarding this application, Mr. Seehofer, a person affected by Alzheimer's, says: "In the past, I forgot my appointments or couldn't find my way, but thanks to this app, I am prompted in time to keep my appointment. For me, it is the perfect solution to keep my independence".

Core features of this application are route planning and reminders for any scheduled appointments. In addition, the app can safely navigate the patient home after a certain period of time spent away from home, using a map (visual) and a voice announcement (acoustic). The entire application can be used by Alzheimer's patients without any prior technical knowledge since the app is designed simply and requires minimal user interaction. All settings and appointments can also be entered by caregivers to make the app even easier to use.

The product can be downloaded now via the app store or the following link: <https://appdownload.hm.edu>. It is offered free of charge and should remain so, because the aim is to help patients with Alzheimer's reliably and safely.
